Cornerstone Inspection

Property Inspection Report

2160 Avenida Redondo, Santa Maria, CA 93458
Inspection prepared For: Diane Kubat
Real Estate Agent: Gary Lehman - Coldwell Banker

Date of Inspection: 10/10/2026 Time: 9:00 AM
Age of Home: 1989 Size: 1536
Weather: Clear
Order ID: 14338

Inspector: Peter Bula
CREIA #167160
P.O. Box 1511, Pismo Beach, 93449
Phone: 805-704-3147
Email: peter@cornerstonecentralcoast.com

CORNERSTONE INSPECTION

INTRODUCTION

We appreciate the opportunity to conduct this inspection for you! Please carefully read your entire inspection Report. After you have reviewed your report, please give us a call if you have any questions at all. Remember, a home inspection is an educational experience, and we encourage you to be present for the inspection so that you can learn more information throughout the entire process.

The observations and opinions expressed within this report are those of Cornerstone Inspection, Inc. and represent only elapsed verbal comments. No inspector at the time of the inspection made any written comments regarding the condition of the property. Cornerstone Inspection, Inc. and the inspector assume no liability for the failure of the client to receive the report contained herein or the inspector's failure to discuss findings with the client. Cornerstone Inspection, Inc. and the inspector may not necessarily appear in the report, because we recognize that our clients' time is valuable, and do not wish to provide you with an unreasonably lengthy report about components that are not in need of service.

In accordance with the terms of the contract, the service recommendations that we make in this report should be completed before the close of escrow by licensed contractors. Any recommendations for further evaluation should be performed prior to the close of escrow by the appropriate specialist.

Photos displayed within the report are intended to illustrate and emphasize areas of concern. The absence of photos may not indicate that no deficiency exists. A licensed specialist retained to evaluate the specific issue.

The terms of various components described within the report such as left, right, front, or rear of the property are described from the perspective of facing the front door from the street. Please refer to the Picture Rule at the front of the home.

This report is the exclusive property of Cornerstone Inspection, Inc. and the client whose name appears herewith, and its use by any unauthorized persons is strictly prohibited.

REPORT SUMMARY

The summary below consists of potentially significant findings. These findings can be a safety hazard, a deficiency requiring a major expense to correct, or items in which it would like to draw extra attention. The summary is not a complete listing of all the findings in the report, and reflects the opinion of the inspector. Please review all pages of the report, including the summary page, for a complete picture of the home. Please call our office if you have any questions or would like to schedule a consultation. I recommend obtaining a copy of all receipts, warranties and permits for any work done on the property.

On this page you will find, in RED, a brief summary of any CRITICAL concerns of the inspector, as they relate to Safety and Function. Examples would be: bare electrical wires, leaks, and drain issues. The complete text of items rated in RED can be found in the body of the report, including Some Maintenance Items. Be sure to read your entire report.

For your safety and liability, we recommend that you hire only licensed contractors when having any work done. If the listing area has been remodeled or part of an addition, we recommend that you verify the permit and certificate of occupancy. This is important because our inspection does not typically uncover, evaluate, or guarantee the integrity of any work that was done without a permit, and latent defects could exist.

Depending upon your needs and those who will be on the property, the contents of the report may also be a concern for you, be sure to read your Inspection Report in its entirety.

Note: If there are no comments in **RED** below, there were no **CRITICAL** system or safety concerns with the property at the time of inspection.

SITE AND OTHER COMMENTS		
Environmental Components	Item 2	2.B. There are carbon monoxide detectors present. Carbon monoxide detectors are important safety components that are required in this jurisdiction. They should be installed at each level of the home, adjacent to the bedroom hallway and any room containing fuel burning appliances.
FOUNDATION COMMENTS		
Crawlspace Observations	Item 1	1A. There is a waste and drain leak beneath the residence, which should be evaluated and repaired by a licensed plumbing contractor.
ROOFING		
Composition Shingle Observations	Item 2	2.B. The skylight is cracked or broken, and should be evaluated by a qualified specialist.
PLUMBING COMPONENTS		
Water Supply Comments	Item 1	1.A. The pressure inside the residence exceeds 80 PSI, which is too strong and will stress plumbing components. A licensed plumber should be contacted to have a pressure reducing valve installed and regulators set to a pressure of 50 PSI.
		1.B. The system includes polybutylene water pipes, commonly referred to as PB, that have been alleged to be problematic, and many have been replaced due to rupture or the concerned, due to a class action lawsuit. However, the time frame for current claims has now likely closed. They were installed between the years 1978 and 1995. Although there are no visible signs of leaks, the flexible plastic pipes that include metal fittings connected by aluminum or copper bands, between them should not be confused with PVC pipes which is white and rigid and commonly used for drain lines.
ELECTRICAL SERVICE PANELS		
Main Electrical Panel	Item 1	1.B. The main electrical panel was manufactured by Federal Pacific Electric Company and employs Stablok breakers which are often more harmful that have been alleged to be defective. However, if a panel is old and the company is now out of business. Although field reports of defects are inconsistent, and many have been in service for decades, it is recommended that a licensed electrical contractor evaluate the panel and recommend either upgrading the panel or seeking a second opinion from a licensed electrician.
INTERIOR SPACES		
Living Room	Item 2	2.C. The smoke detector did not respond to the test button, and should be serviced.
Main Hallway	Item 2	2.C. The smoke detector did not respond to the test button, and should be serviced.
BEDROOMS		
Primary Bedroom Observations	Item 1	1. There is no smoke detector, which is mandated in this jurisdiction and should be installed.
		1A. One or more of the single hung windows will need to have its hardware serviced to properly stay in place when opened. Single hung windows are typically designed so that the lower portion slides up and down.
Bedroom 2	Item 3	3.1. There is no smoke detector, which is mandated in this jurisdiction and should be installed.
Bedroom 3	Item 3	3.1. There is no smoke detector, which is mandated in this jurisdiction and should be installed.
KITCHEN		
Electrical Components	Item 4	4.E. The countertop outlets are functional, but should be upgraded to have ground fault circuit interrupter protection installed for safety. This is a common upgrade recommendation.
Sink and Faucet	Item 5	5.C. There is a leak at the drain trap below the sink, which should be repaired.
HEATING & AIR CONDITIONING		
Forced Air Furnace	Item 1	1.D. The furnace is functional. However, it is beyond the commonly accepted design life of twenty-five years. Although it is not necessarily in need of repair or replacement at this time, it is recommended that you have it serviced and evaluated by a qualified HVAC contractor prior to the close of the escrow period.
		1.E. There is a pin or metal hinge within the visible portions of the heat exchanger, combustion chamber, or other furnace components. We recommend an evaluation by a qualified professional and service as necessary.
GARAGES		
Double-Car Garage	Item 1	1.B. The house entry door is not self-closing and latching and should be serviced for optimal safety.
		1.E. The house entry deadbolt does not fully engage, and should be serviced.

SITE AND OTHER COMMENTS

1 Site and General Information

Observations

1.1 The buyers/clients were not present during the inspection.

1.2 The property was vacant during our inspection.

1.3 Access to some items such as: electrical outlets/receptacles, windows, wall/floor surfaces, and cabinet interiors may be restricted by furniture or personal belongings. Any such items are excluded from this inspection report.

1.4 If you have received this report from the seller(s) of the property, or a real estate agent in order to help satisfy part of their transfer disclosure obligation, you should not rely on this report for your evaluation of the property as the report was not prepared for your use. Cornerstone Inspection, Inc. has a confidential agreement and a Standards of Practice that is not in place for any third party or subsequent buyer of this property. Our report is valid for the day of our inspection only. Conditions could have changed since the date of inspection and we assume no liability for any such changes.

1.5. We do not inspect window coverings as a part of our service.

1.6. Our inspection does not include the inspection of any fire, alarms, alarms or other issues may be concealed from view. Please thoroughly review all disclosures, contact the sellers to discuss any questions you may have, and have the system serviced.

1.7. We prefer to have our clients present during or immediately following the inspection, so that we can elaborate on what may not be complicated or technical issues that may be challenging for the layperson to effectively communicate in a written report. Unfortunately, you were not present during the inspection, and we encourage anyone utilizing this report to read the entire report, not just the summary, and to consult with a directly regarding any questions or concerns. In addition, please do not rely on anything we may have been purported to have stated, unless it is also noted in the report.

1.8 If you have received this report without a signed contract agreement, contact Cornerstone Inspection immediately to arrange for a contract. This inspection is invalid without a signed contract. Cornerstone Inspection, Inc. and the inspector assume no liability for the inspection performed and can be and reserved by e-mail or Doc Out Insurance requires a contract before inspection, and without one, there is no insurance coverage.

1.9. Because this is a report on a mobile home within a managed park, we did not inspect on the condition of any components beyond the unit, such as grading and drainage, which is believed to be the responsibility of the park, and not the individual unit owner.

1.10. Over the life of a mobile home it will need to be re-leveled every 7 to 10 years. We do not evaluate the level of a mobile home, but do recommend that you have it evaluated by a licensed specialist in the event that it does not be within the level it was set to be.

2 Environmental Comments

Observations

2.1 It is recommended that smoke detectors older than 10 years old be replaced due to safety concerns as the sensors may no longer be effective.

2.2. There are no carbon monoxide detectors present. Carbon monoxide detectors are important safety components that are required in this jurisdiction. They should be installed at each level of the home, adjacent to the bedroom hallway, but not any closer than 10 feet (3.05 m) to gas appliances.

2.3 Current standards require at least one smoke detector installed on every level of a home. One of the levels of the residence does not contain a functional smoke detector, which should be serviced.

EXTERIOR

1 General Comments and Disclaimers

It is important to maintain a property, including painting or sealing windows, decks, and other hard surfaces. It is particularly important to keep the house walls adequately painted or sealed. Deferred maintenance can substantially increase the cost of ownership. Maintenance is the responsibility of the owner and includes the principal purpose of the observations in this report. Identifying and correcting minor problems as they occur is usually far less costly and time consuming than deferred maintenance. However, for example, we may discover leaking windows while it is raining that may not have been apparent otherwise.

2 Grading and Drainage

Observations

2.1. Water can be destructive and foster conditions that may be hazardous to health. For this reason, the ideal property will have soils that slope away from the residence. The ideal finish line would be several inches higher than the soil next to the residence. Soil that is level with the footings and downspouts that discharge too close drains with catch basins that catch water, keep its hard surface. However, we cannot guarantee the condition of any subterranean drainage system. If a property does not meet the ideal, it is not necessarily a defect, but it is a condition that could contribute to water intrusion and should be monitored during the rainy season. Any area where water may pond or pool should be corrected. Any area where water may pond or pool should be corrected. Any area where water may pond or pool should be corrected

PLUMBING COMPONENTS

1 Water Supply Comments

Observations

1.1. The main water shut off valve is located at the front of the home, unit, or building, at the meter.

1.2. The pressure relief valve is in acceptable condition, but we did not operate the valve as the risk of over-pressurization is low. Over-pressurization can damage the water heater and cause it to leak.

1.3. The pressure inside the residence exceeds 80 PSI, which is a cost-saving and will stress components of the system. We recommend that a regulator be installed by a licensed plumbing contractor. Most regulators come factory preset to 50 PSI.

1.4. The system includes polybutylene water pipes, commonly referred to as PB. PB have been alleged to be defective, and many have been replaced at no cost to the consumer, due to a class action lawsuit. However, the time limit for the lawsuit has expired. Most PB pipes in this area were installed in homes between 1979 and 1995. They are easily recognizable as gray, blue, or black flexible plastic pipes that include insert fittings connected by aluminum or copper bands; however, they should not be confused with PVC pipes. We believe applicable pipes should be replaced if feasible.

The main water shut off valve is located at the front of the home, unit, or building, at the meter.

Some water fittings and fixtures are corroded. Some of these fittings need to be sealed.

2 Gas Service Information

Observations

2.1. Natural gas is stored in the manufacturing process. Should you smell the distinctive odor of natural gas or hear a hissing sound near a natural gas line or appliance, you should shut off the gas at the main and clear the area, immediately call the Gas Utility Company from a safe location. Gas leaks can be difficult to detect. Gas leak detectors are inexpensive and available at most hardware stores. We recommend that you request a leak test before the sellers, so that you can establish a baseline and be informed in any potential leak by a plan or signage.

2.2. The gas main shut off is located on the left side of the home, unit or building.

2.3. The visible portions of the gas pipes appear to be in acceptable condition.

2.4. We recommend that a sediment, designed to fit the gas shut off valve, be located on or adjacent to the gas meter to facilitate an emergency shut off.

The gas meter shut off is located on the left side of the home, unit or building.

3 Irrigation and Hose Bibb Information

Observations

3.1. We do not evaluate sprinkler systems, which should be demonstrated as functional by the sellers.

3.2. The hose bibs that we tested are functional, but do not have backflow valves. These valves are relatively inexpensive, and are required by current standards. However, we may not have located and tested every hose bib on the property.

4 Gas Water Heater Comments

Observations

4.1. Hot water is provided by a 40 gallon gas water heater that is located in an exterior closet.

4.2. The water heater is functional and there were no leaks at the time of our inspection.

4.3. The water heater is about 4 years old.

4.4. There is rust, corrosion, or mineral encrustation on the fittings of the gas water heater, which should be evaluated and serviced by a qualified plumbing contractor.

4.5. The gas control valve and its connector at the water heater are presumed to be functional.

4.6. The anti-siphon property connector it is required to have a minimum of 3 fasteners where the pipe connects to the draft hood or other single wall vent pipes.

4.7. There are moisture stains on the ceiling or the vent pipe which should be explained or further explored. It could indicate the vent vent flashing is not properly sealed.

4.8. The water heater is equipped with a mandated pressure & temperature relief valve.

4.9. The drain valve of the gas water heater is in place and presumed to be functional.

4.10. The water heater is equipped with a drip pan and a drainpipe, which is designed to prevent water damage from a leak. Nevertheless, the water heater should be periodically monitored for any signs of a leak.

4.11. We recommend adding a moisture sensor to the pan, which will alert to the presence of a water leak. Many of the sensors are wireless and can be controlled with your smartphone. Sensors are inexpensive.

4.12. The water heater appears to have adequate combustion air.

4.13. The water heater is seismically secured.

The water heater is functional, but it is not equipped with a drain pan. Drain pans are required to be installed in all exterior closet...

The drain valve of the gas water heater is in place and presumed to be functional.

5 Waste and Drain Systems

Observations

5.1. The visible portions of the drainpipes are a modern acrylonitrile butadiene styrene type, or ABS.

5.2. We attempt to evaluate drain pipes by flushing every drain that has an active fixture while attempting to discharge or slow drains, but this is not a conclusive test and only a video scan of all the main line would confirm no blockages. However, you can buy a small plunger-bit snake, usually less than $20, and clear most blockages. Many hardware stores will rent you a larger snake. Some drains may have been recently cleared by the sellers. We note that slow drains usually develop after any chemical treatment is discontinued, and clearing the traps. However, if the slow drains are the main drain line, we recommend that a video scan be performed by a licensed plumber. Video scans are relatively inexpensive, and are required by current standards. However, we may not have located and tested every hose bib on the property. Even when it they have experienced any drainage problems, or that which will start to leak the main waste line video scanned before the close of escrow. Failing this, you should budget for the cost of repair or replacement of the drain line. Damage to the main line, however, most policies only cover physical repairs within the house, or the cost of waste service, most of which are relatively inexpensive.

5.3. Based on industry recommended water tests, the drainpipes are functional at this time. However, only a video scan of the main drainpipe could confirm its actual condition.

5.4. A clean-out is located at the front.

A clean-out is located at the front.

ELECTRICAL SERVICE PANELS

1 Main Electrical Panel

Observations

1.1. Common wallet safety standards require electrical panels to be weather proof, readily accessible, and have a minimum of thirty-six inches of clear space in front of them for service. Also, they should have a main disconnect, and each circuit within the panel should be clearly labeled. Industry standards only require us to test a representative number of the switches, receptacles, and lighting fixtures. We operate as many as we deem appropriate, but it is impossible to test all, and we usually do not test every switch.

1.2. The residence is served by a 100 amp main electrical panel, located at the left side of the home at unit.

1.3. The visible wiring for the main electrical panel is in acceptable condition.

1.4. The interior cover for the main electrical panel is in acceptable condition.

1.5. The main conductor lines are underground, or contained in what is described as a lateral service entrance. This is characteristic of a modern electrical service but, inasmuch as the service lines are underground and cannot be seen, they are not considered as part of our service.

1.6. The wiring in the main electrical panel has no visible deficiencies.

1.7. The residence is predominantly wired with a three -wire non-metallic cable commonly known as Romex.

1.8. There are visible deficiencies with the circuit breakers in the main electrical panel.

1.9. The main electrical panel is grounded to a water pipe.

1.10. Current standards require the panel to be double-grounded, and you may wish to consider having this done as a safety upgrade. However, such an upgrade is not currently mandated.

1.11. The main electrical panel was manufactured by Federal Pacific Electric Company and employs Stablok breakers and other components that have been alleged to be defective. However, the panel is old and the company is no longer in business, although field reports of defects and dangers were never apparently substantiated by laboratory tests. They have been numerous and widespread enough for us to recommend that you budget for the cost of upgrading the panel or panels in general before the close of escrow.

The residence is served by a 100 amp main electrical panel, located at the left side of the home at unit.

The visible wiring for the main electrical panel is in acceptable condition.

The main electrical panel was manufactured by Federal Pacific Electric Company and employs Stablok breakers and other...

2 Sub Panel Observations

Observations

2.1. Sub-panels are often located inside residences, but they should not be located inside clothes closets, where they might be concealed and could impede an emergency disconnect. However, other they are located inside they are required to be weatherproof, unobstructed, and easily accessible, and their circuits should be clearly labeled.

2.2. The sub panel is located within the patio room.

2.3. The electrical sub panel has no visible deficiencies.

2.4. The exterior cover for the electrical sub panel is in acceptable condition.

2.5. The interior cover for the electrical sub panel is in acceptable condition.

2.6. The wiring in the sub panel has no visible deficiencies.

2.7. The circuit breakers have no visible deficiencies.

2.8. The grounding system in the sub panel is correct.

The sub panel is located within the patio room.

INTERIOR SPACE

1 Walls Entry

Observations

1.1. The front door is functional but not fully weather sealed and could be subject to moisture intrusion especially during wind-driven rain.

1.2. The door handle lock needs to be serviced to work smoothly.

The door handle lock needs to be serviced to work smoothly.

2 Living Room

Observations

2.1. The living room is located adjacent to the main entry.

2.2. The smoke detector did not respond to the test button, and should be serviced.

3 Dining Room

Observations

3.1. The dining room is located adjacent to the main entry.

3.2. One or more ceiling lights do not respond and should be serviced.

4 Walls Hallway

Observations

4.1. The hallway leads to bedrooms 2 and 3.

4.2. One or more ceiling lights do not respond and should be serviced.

4.3. The smoke detector did not respond to the test button, and should be serviced.

BEDROOMS

1 Primary Bedroom Observations

Observations

1.1. This bedroom is located adjacent to the living room.

1.2. The walls/ceiling have shrinkage fractures which may have resulted from movement. I can elaborate on this issue, but you should have a specialist comment, and be aware that such cracks can reappear, and typically if they are not repaired correctly.

1.3. There is no smoke detector, which is mandated in this jurisdiction and should be installed.

1.4. One or more of the single hung windows will need to have its tracks balanced to operate properly. Single hung windows are typically designed so that the lower pane opens and stays in an open position.

One or more of the single hung windows will need to have its tracks balanced to operate properly. Single hung windows are typically...

The walls/ceiling have shrinkage fractures which may have resulted from movement. I can elaborate on this issue, but you should have a...

2 Bedroom 2

Observations

2.1. This bedroom is located at the end of the main hallway to the left.

2.2. The closet doors are missing, and one may wish to have them reinstalled.

2.3. There is no smoke detector, which is mandated in this jurisdiction and should be installed.

3 Bedroom 3

Observations

3.1. This bedroom is located at the end of the main hallway to the right.

3.2. There is a moisture stain on the ceiling that should be explained or further explored.

3.3. There is no smoke detector, which is mandated in this jurisdiction and should be installed.

There is a moisture stain on the ceiling that should be explained or further explored.

KITCHEN

1 General Comments

Observations

1.1. We test kitchen appliances for their functionality and cannot evaluate them for their performance nor for the variety of their settings or cycles. However, if they are older than ten years, they may well exhibit decreased efficiency. Regardless, we do not inspect the following items: refrigerators, built-in toasters, coffee makers, can openers, blenders, trash/can water dispensers, reverse osmosis systems, barbecues, grills, rotisseries, timers, clocks, thermostats, the self-cleaning capacity of ovens, and microwave ovens' leakage. Any stove is warranted for a short period after the inside construction and possessed by extension costs or unprotected contacts.

2 Cabinets

Observations

2.1. The kitchen cabinets have typical, cosmetic damage, or that which is commensurate with their age.

3 Countertop

Observations

3.1. The countertop has typical damage, such as small cracks or scuffs which you should view for yourself.

4 Electrical Components

Observations

4.1. One or more ceiling lights do not respond and should be serviced.

4.2. The countertop outlets are functional, but should be upgraded to have ground fault protection, which is mandated by current standards and is an important safety feature.

5 Microwave Oven

Observations

5.1. The built-in microwave is functional but we did not test it for leakage, which would require a specialized instrument.

6 Sink and Faucet

Observations

6.1. The sink is functional.

6.2. The faucet leaks around the stem while in use and should be serviced.

6.3. The valves and connector below the sink are functional.

6.4. There is a leak at the drain trap below the faucet which should be repaired.

There is a leak at the drain trap below the faucet which should be repaired.

The faucet leaks around the stem while in use and should be serviced.

7 Dishwasher Comments

Observations

7.1. The dishwasher is functional.

8 Exhaust Fan

Observations

8.1. The exhaust fan on downdraft is functional.

9 Gas Range & Cook Top

Observations

9.1. The gas cooktop is functional.

10 Built-In Ovens

Observations

10.1. The built-in gas oven did not respond, and should be serviced.

BATHROOMS

1 Primary Bathroom Observations

Observations

1.1. The primary bathroom is a three-quarter suite and is located adjacent to the primary bedroom.

1.2. The cabinets are in acceptable condition.

1.3. The sink countertop has cosmetic damage you should view for yourself, such as cracks, chips, or missing grout.

1.4. The bathroom sink is conventional not seeking, but will obviously be susceptible to leaks.

1.5. The sink faucet and its components are functional.

1.6. The tub and shower are functional.

1.7. The toilet is functional and includes ground fault protection.

1.8. The lighting are functional.

1.9. The exhaust fan is functional.

The sink countertop has cosmetic damage you should view for yourself, such as cracks, chips, or missing grout.

One or more open seams in the shower area need to be caulked to prevent moisture intrusion.

The shower door is loose or does not sit smoothly and the door guides may need to be serviced or replaced.

The shower valve handle is loose or does not function properly and should be serviced.

The tub and shower is loose or does not sit smoothly and the door guides may need to be serviced or replaced.

2 Hallway Bathroom

Observations

2.1. The hallway bathroom is a full and is located adjacent to the hallway.

2.2. The cabinets are in acceptable condition.

2.3. The sink countertop has cosmetic damage you should view for yourself, such as cracks, chips, or missing grout.

2.4. The sink is functional.

2.5. The sink faucet and its components are functional.

2.6. The tub and shower are functional.

2.7. The outlets are ground-fault protected and controlled from a GFCI outlet/breaker in the primary bathroom.

2.8. The lights are functional.

2.9. There is no exhaust fan and although there are operable windows, we recommend one be installed.

2.10. The toilet is not identified as being a low-flush type and should be replaced with a 1.28 GPF toilet to meet current California water conservation standards.

2.11. The tub shower is functional and the showerhead is 2.5 gpm.

2.12. The tub or shower faucet drips, and should be repaired or replaced.

The tub or shower faucet drips, and should be repaired or replaced.

LAUNDRY

1 Laundry Room

Observations:

1.1. The laundry room is located adjacent to the garage.

1.2. The water supply to washing machines is commonly left on, and over time, the rubber hoses that are commonly used to supply water can become stressed and burst. For this reason, we recommend replacing all rubber supply hoses with metal-braided ones that are coupled with emergency water shut off devices for better protection.

1.3. The back-draft on the exterior dryer vent cover is missing, stuck open, or incomplete and should be cleaned, repaired, or replaced.

1.4. A gas supply valve is installed, but needs an approved connector that attaches the gas to the dryer. If not in use, the gas valve should be capped.

1.5. The outlets that were tested are functional.

1.6. The 220 volt receptacle is functional.

1.7. The lights are functional.

1.8. The exhaust fan has been removed or was never installed, which is recommended in laundry rooms.

1.9. The cabinets are functional, and do not have any significant damage.

The back-draft on the exterior dryer vent cover is missing, stuck open, or incomplete and should be cleaned, repaired, or replaced.

2 Laundry Area

Observations:

2.1. The water supply to washing machines is commonly left on, and over time, the rubber hoses that are commonly used to supply water can become stressed and burst. For this reason, we recommend replacing all rubber supply hoses with metal-braided ones that are coupled with emergency water shut off devices for better protection.

HEATING & AIR CONDITIONING

1 Forced Air Furnace

Observations:

1.1. Central heat is provided by a forced-air furnace that is located in the attic.

1.2. Serial Number 0989975792 - Manufactured 1989

1.3. The vent pipe is functional.

1.4. The gas valve and connector are in acceptable condition.

1.5. The combustion-air vents for the gas furnace are functional.

1.6. There is no air filter within the heating system, which should be installed.

1.7. The blades and motor on the circulating fan and motor are dirty. They should be cleaned, and the filters changed regularly, as part of a scheduled maintenance service. We recommend that a qualified HVAC contractor clean, service and evaluate the furnace.

1.8. The thermostat is functional.

1.9. Significant portions of the supply ducts are concealed and cannot be viewed.

1.10. The registers are reasonably clean and functional.

1.11. The furnace is functional. However, it is beyond the commonly accepted design life of twenty years, and will need to be monitored more closely for evidence of metal fatigue. We recommend that you have it serviced and evaluated by a qualified HVAC contractor prior to the close of the inspection period.

1.12. There is rust or metal fatigue within the visible portions of the heat exchanger, combustion chamber, or other furnace components. We recommended an evaluation by a qualified tradesperson and service as necessary.

Central heat is provided by a forced-air furnace that is located in the attic.

Serial Number 0989975792 - Manufactured 1989

The blades and motor on the circulating fan and motor are dirty. They should be cleaned, and the filters changed regularly, as part ...

GARAGES

1 Double-Car Garage

Observations:

1.1. The side door striker plate needs to be adjusted for the striker pin to engage.

1.2. The slab floor is in acceptable condition. Small cracks are common and result as a consequence of the curing process, seismic activity, common settling, or the presence of expansive soils, but are not structurally threatening. Also, you may notice some salt crystal formations that are activated by moisture penetrating the slab.

1.3. There are no ventilation ports to vent exhaust fumes. Therefore, vehicle engines should not be left running with the garage door closed or carbon monoxide poisoning could result.

1.4. The firewall separating the garage from the residence is functional.

1.5. There is a moisture stain on the garage wall, the cause of which should be explained or explored further. However, we were not able to confirm that it is being caused by an active leak.

1.6. The outlets that were tested are functional, and include ground-fault protection.

1.7. The lights are functional, and do not need service at this time.

1.8. The garage door and its hardware are functional.

1.9. The garage door opener is functional.

1.10. The house entry door is not self-closing and latching and should be serviced for optimal safety.

1.11. The house entry deadbolt does not fully engage, and should be serviced.
